The present invention relates to novel G protein-coupled receptors (GPCRX; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences. The present sequence is the coding sequence toth G protein-coupled receptor. G sequence is the coding sequence buch G protein-coupled receptor. G PCRS are also known as seven transmembrane receptors and function in signal transduction. The inGPCRX coding sequences are useful for c screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRX are useful for GPCRX in a sample is useful for treating schizophrenia. Detection of nGPCRX in a sample is useful as a diagnostic tool for disease or disorders, infections such as HIVIT, metabolic and cardiovascular diseases, proliferative disorders, renal failure, rheumatoid arthritis, conference of servity have the utility for treating neurological disorders, of nGPCRX activity have the utility for treating neurological disorders, of disease, parkinson's disease, migraine and senile dementia. Additional disorders such as Alzhaner's disease, parkinson's disease, migraine and senile dementia. Additional disorders concers, concers, relating a liments such as asthma, and inflammatory diseases e.g.
                                                                                                                                                                                                                                                                                          ₹
                                                                                                                                                                                                                                                                                                                                                                                        New G protein-coupled receptor (mGPCR-x) and its encoding polynucleotide useful for diagnosing and treating e.g. schizophrenia
                                                                                                                                                                                                                                                                   RR, Lind P, Slightom J; Ruff V, Sejlitz T, Huff

```
The present sequence encodes a human G-coupled protein receptor, designated AXOR29 polypeptides and polynucleotides are useful for treating and diagnosing infections and with as bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancers, diabetes, obesity, anorexia, bulimia, asthma, Parkinson's diseases, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disporders including anxiety, schizophrenia, maint depression, depression, delinium, dementia and severe mental retardation. The polypeptide is also useful
Parkinson's disease, acute heart failure; hypertension; angina pectoris; urinary retention; osteoporosis; myocardial infarction; stroke; ulcer; allergy; benign prostatic hypertrophy, migraine; vomiting; schizophrenia; psychotic disorder; neurological disorder; anxiety; manic depression; depression; delixium; dementia; mental retardation; vaccine; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel G-coupled protein receptor, AXOR29 useful for treating diseases such as microbial infections, cancers, obesity, asthma, diabetes, dispension, osteoporosis, myocardial infarction and neurological disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sarau HM;

```

The present sequence encodes human PFI-006 which is a putative G-protein coupled receptor (GPCR). PFI-006 was identified from chromosome 19.

PFI-006 has anorectic, antidiabetic, neuroprotective, neuroleptic, notropic, psychotropic, antidiaflammatory, cytostatic, vulnerary, correctic, antidiaflammatory, cytostatic, vulnerary, dermatological, osteopathic, cardiovascular and antiallargic activities. It can be used in pharmaceuticals or in the manufacture of medicaments for the treatment of a patient having need to modulate, i.e. agonise or selectively) antagonise PFI-006 protein. A compound which modulates or PFI-006 can be used in diagnosing and treating a variety of diseases. These are also used in diagnosing and treating a variety of diseases. These are also useful for evaluating and/or screening gents that can modulate the GPCR. In particular, they are useful for screening drug candidates for treating diseases associated with signal transduction, including obesity, dispetes and metabolic disease, neurological disease, including obesity, dispetes and metabolic disease, neurological disease. psychotherapeutics, urogenital disease, reproduction and sexual medicine, inflammation, cancer, tissue repair, dermatology, skin plymentation, photoaging, frailty, osteoporosis, cardiovascular disease, gastrointestinal disease, antlinfection, allergy and respiratory disease, sensory organ disorders, sleep disorders or hair loss

```
The present sequence encodes a polypeptide which is a G-protein coupled receptor (GPCR) related to the EDG (undefined) receptor family, and is designated the 14274 receptor. The receptor polypeptides are useful for producing antibodies specific for the GPCR 14274 receptor protein, and in drug screening assays, in cell-based or cell-free systems. The receptor activity, that is compounds which stimulate or inhibit interaction between the receptor protein and a target molecule. Modulators of receptor protein activity are used to treat subjects with a disorder mediated by the GPCR 14274 receptor pathway, such as, a disorder mediated by the GPCR 14274 receptor protein activity are used to treat subjects with a disorders of the spleen (such as splennemgraly), lung disorders (such as arenoals, enterocolitis), disorders of the liver (such as a remails, stenoals, enterocolitis), disorders of the liver (such as carebral edema, cholestasis), disorders of the brain (such as cerebral edema, cerebrovascular disease, Alzhelmen's disease, Parkinson's disease), disorders involving T-cells (such as autoimmune diseases, transplant

The present sequence is a CDNA encoding hCHN6, an endogenous human corphan G protein-coupled receptor (GPCR). The hCHN6 CDNA was identified using ESTS (expressed sequence tag) AA804531 and 2134670 as a probe.

The orphan GPCR of the invention, like all GPCRs has seven transmembrane atpha helices with an extracellular Neterminus and an intracellular cappa proteins of the invention. The orphan GPCRs may be used in the the proteins of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue localisation expression analysis to provide information about their transitive their contrion in healthy and pathological states.
                                                                                                           Novel human orphan G protein-coupled receptors and the encoding cDNAs for use in the identification of G protein-coupled receptor agonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         426
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       307 atggagtcggggctgctgcggccggcggtgagcgaggtcatcgtcctgcattacaac 366

                                                                                                                                                                                                                                                                                                           The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                              The present sequence is rat G protein-coupled receptor (GPCR), BIC3 CDNA which is expressed in the central nervous system of rats. BIC3 nucleic acids and recombinant proteins are useful in assays to identify agents capable of binding to the receptor, which modulate intracellular signalling such as adenyl cyclase activity or intracellular calcium concentration. These agents have potential therapeutic applications as either analgesics or anaesthetics. BIC3 receptors are also useful for screening drug candidates using cell signalling assays. Antibodies to BIC3 are useful in purification of intact receptor.

```
The present sequence encodes mouse EDG1. Agonists and antagonists of mouse EDG1 are useful for treating patients with enhanced or inhibited activity or expression of EDG1. The EDG1 polypeptide is useful for treating abnormal conditions such as infections caused by bacteria, fungl etc., pain, cancer, diabetes, obesity, anorexia, bulimia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, uninary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, allergies, benign prostatic hypertrophy, migraine and vomiting. It is useful for treating psychotic and neurological disorders including anxiety, schizophrenia, manic depression, delirium, dementia and severe mental retardation and dyskinesias such as Huntington's disease or Gilles dela Tourett's
                                                                                                                                                                                                                                 Murine EDG1 polypeptide useful for treating infections and diseases such as cancer, diabetes, Parkinson's disease, allergies, and neurological disorders such as anxiety schizophrenia, depression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 11.49 BP; 257 A; 347 C; 255 G; 290 T; 0 other;

```
This sequence encodes human EDG-2.
The invention relates to methods of detecting (ant)agonist, inverse agonist or allosteric modulators of the lysophosphatidic acid receptors EDG-1, EDG-2, EDG-4, EDG-5, and PSP-24. The methods are used to identify (ant)agonists and allosteric modulator of the lysophosphatidic acid (LPA) FDG2 receptor, e.g. to treat LPA signalling mediated disease such cellular apoptosis.
                                                                                                                            771

The sequence represents the LPA receptor (LPA), EBG-2. The sequence is analysis of lysophosphatidic acid receptor (LPA), EBG-2. The sequence is given in the specification but no further information is given. LPA is a phospholipid found in variety of plant and animal products. EBG-2 is phospholipid found in variety of plant and animal products. EBG-2 is involved in cell signalling through activation of a MAP kinase cascadedependent reporter. Modulating the activity of a lysophosphatidic acid (LPA) or LPA receptor (EBG-2) involves introducing a composition comprising LPA modulators to the LPA or receptor. The method is useful for treating diseases haracterised by slowed growth or repair of neuronal cells, neurodegenerative diseases, such as Alzheimer's disease, Parkinson's disease, and acute neuron damage, for modulating apoptotic nathwave and treating ischaemic heart disease, tumours, viral diseases
                                                                                                                                                                                  LPA receptor; EDG-2; lysophosphatidic acid; phospholipid; tumour; cell signalling; MAP Kinase; LPA modulator; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; neuron damage; apoptosis; lschaemic heart disease; viral; HIV; inflammatory bowel disease; organ transplant; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Modulating activity of a lysophosphatidic acid or its receptor for treating tumours, viral diseases, involves introducing to LPA or its receptor a composition containing diol, epoxide or phosphate compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1149 BP; 257 A; 345 C; 257 G; 290 T; 0 other;

The present invention relates to novel G protein-coupled receptors (nGPCRx; where x is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences. The present sequence is the coding sequence such G protein-coupled receptor. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for creening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for C predisposition, specifically schizophrenia. nGPCRx are useful for nGPCRx in a sample is useful as a diagnostic tool for diseases or nGPCRx in a sample is useful as a diagnostic tool for diseases or disorders, infections such as HTV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for treating neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disorder/attention deficit disorder), and neuronal disorders such as Alzhelmer's disease, Parkinson's disease, migraine and senile dementia. Additional disorders include inflammatory conditions (e.g. Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 respiratory ailments such as asthma, and inflammatory diseases e.g. inflammatory bowel disease,

This sequence is a novel rat cDNA which encodes p(rat-edg), a member of the G-protein coupled receptor superfamily of proteins. The amino acid similarity between p(H218) (AAW01663) and p(rat-edg) (AAW01664) suggests that they may be activated by the same endogenous ligand(s). The expression pattern of mRNA transcripts of both genes in cell lines, various rat tissues and developing rat brain suggests that they both play a role in cell proliferation and/or differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            p(H218); G-protein coupled receptor; cell differentiation; proliferation; proline directed kinase; cell division; growth factor response; rat-edg; therapy; diagnosis; ss.

New isolated polynucleotide encoding a G-protein coupled receptor used to develop products for use in diagnosis and therapy of conditions involving cell proliferation and differentiation

```
The present sequence encodes a protein designated rat-edg. The rat-edg polypeptide is a member of the G-protein coupled receptor superfamily. The specification also describes a protein designated H218, which is also a member of the G-protein coupled receptor superfamily. H218 is also a member of the G-protein coupled receptor superfamily. H218 is involved in cell proliferation and differentiation, and in disease states such as cancer. The polynucleotides and polypeptides can be used to develop products for diagnosis and therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                336
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gagaatctagccgtgttggttggtgctcggacgccacccgcgcttccacgctcccatgttc 216

This invention describes a novel human selective receptor for sphingosine-1-phosphate and dihydro sphingosine-1-phosphate, designated aphingosine-1-phosphate, designated aphingosine-1-phosphate, designated and dihydro sphingosine-1-phosphate, designated and discolar antimicrobial, antimicrobial, antimicrobial, antimicrobial, antimicrobial, antimicrobial, antimicrobial, designated, cytostatic, antimicrobial, antimicrobial, and designated, cytostatic, antimicrobial, antimicrobial, diseases associated with inappropriate EDG-1c activity or levels. EDG-1c diseases associated with inappropriate EDG-1c activity or levels. EDG-1c polypeptides and polynucleotides, agonists, antagonists and antibodies are used to treat diseases, including infections such as bacterial, fungal, protozoan and viral infections, sapecially HIV-1 or HIV-2; pain; ancerts disease; acute heart failure; hypertension; hypotension; urinary consessis, and pectoris; myocardial infarcino; stroke; congestive heart failure; left ventricular hypertrophy; anriphymia's; cestenosis; artherosolerosis; inflammation; angiogenesis; wound healing; ulcers; allergies; benign prostatic hypertrophy; migraine; compestive diseases fibrosis; artherosolerosis; inflammation; angiogenesis; or hearing, psychotic and neurological disorders, including anxiety, conting; psychotic and neurological disorders; including anxiety, conting; psychotic and neurological disorders; including anxiety, conting, psychotic and neurological disorders; including anxiety, conting, psychotic and neurological disorders; including anxiety, conting, manual retardation; degenerative diseases and degenerative diseases and scowere of primers and dyskinesias such as neurodegenerative diseases of dilles dela Tourett's syndrome. The polynucleotide is also useful as a source of primers and probes, and also the method of the invention.

This invention describes novel human and murine G-coupled receptors EDG (endothelial differentiation gene) 6 (I and II). The products of the invention have antilnflammatory, immunomodulatory, antimicrobial, antialized and cytostatic activity. (I) and (II) are involved in signal transduction. (I), (II) and their fragments, variants and mutants or binding patienters, are used therapeutically to modulate the function of blood and look cells, particularly for inhibition of acute and chronic inflammation and to raise specific antibodies against them. They are used as a source of diagnostic oligonucleotides and for gene therapy. Antibodies, against (I) and (II) are useful for diagnosis and optionally when coupled to therapeutic agents, toxins or other antibodies, to modulate immune and inflammatory responses for example immunological defects such as inflammation, infection, autoimmune diseases, allergy, tumors, lenkemia and lymphoma. This sequence encodes the human EDGG protein described in the method of the invention.
                                                                                                                                 New human and murine G-coupled receptor EDG (endothelial differentiation gene) 6, useful for modulating inflammatory and immune reactions and for treatment of allergy or tumors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cogogettecacgeteceatgtteetgeteetgggeageeteacgttgteggatetgetg 252

                                                                                                                                                              (GPCRX; where X is 1, 3, 4, 5, 9, 11, 12, 14-18, 20, 21, 22, 24, 27, 28, 31-38, 40, 41, 53-60) and their coding sequences. The present sequence is one such G protein coupled receptor. GPCRs are also known as sequence is one such G protein coupled receptor. GPCRs are also known as sequence is one such G protein coupled receptor. GPCRs are also known as seven transmembrane receptors and function in signal transduction. The nGPCRx coding sequences are useful for screening a human to diagnose a disorder affecting the brain or a genetic predisposition, specifically schizophrenia. nGPCRx are useful for identifying compounds useful for treating schizophrenia. DGPCRx are useful for identifying compounds useful as a diagnostic tool for diseases or disorders, infections such as HIV-1, metabolic and cardiovascular diseases, proliferative disorders and hormonal disorders. Modulators of nGPCRx activity have the utility for treating neurological disorders, including schizophrenia, ADHD/ADD and neurological disorders, including schizophrenia, ADHD/ADD and neuronal disorders such as Alzelmer's disease, Parkinson's disease, migraine and senile dementia. Additional disorders include inflammatory conditions (ed. G. G. Crohn's disease), rheumatoid arthritis, autoimmune disorders, cancers, respiratory alments such as asthma, and inflammatory disease.

AXOR29 polypeptides and polynucleotides are useful for treating and diagnosing infections such as bacterial, fungal, protozoan and viral infections, particularly infections caused by HIV-1 or HIV-2, pain, cancers, diabetes, obesity, anorexia, bulimia, asthma, Parkinson's diseases, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, allergies, benign prostatic myocardial infarction, stroke, ulcers, allergies, benign prostatic hypertrophy, migraine, vomiting, psychotic and neurological disorders including anxiety, schizophrenia, manic depression, depression, delirium, dementia and severe mental retardation. The polypeptide is also useful as a vaccine for inducing immunological response in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cancer; diabetes; obesity; anorexia; bulimia; asthma; hypotension; Parkinson's disease; acute heart fallure; hypertension; angina pectoris; urinary retention; osteopozosis; myocardial infarction; stroke; ulcer; allergy; benign prostatic hypertrophy; migraine; vomiting; schizophrenia; psychotic disorder; neurological disorder; anxiety; manic depression; depression; delirium; dementia; mental retardation; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; G-coupled protein receptor; AXOR29; infection; HIV-1; HIV-2; pain;

The present sequence is human PFI-006 which is a putative G-protein coupled receptor (GPCR). PFI-006 was identified from chromosome 19. PPI-006 has anorectic, antidiabetic, neuroprotective, neuroleptic, noctropic, psychotropic, artidinflammatory, cytostatic, vulnerary, dermatological, osteopathic, cardiovascular and antialiery activities. It can be used in pharmaceuticals or in the manufacture of medicaments for the treatment of a patient having need to modulate, i.e. agonise or (selectively) antagonise PFI-006 protein. A compound which modulates PFI-006 can be used in dagnosing and treating a variety of diseases. These are also useful for evaluating and/or screening agents that can modulate the GPCR. In particular, they are useful for screening drug candidates for treating diseases associated with signal transduction.

including obesity, diabetes and metabolic disease, heurological disease, psychotherapeutics, urogenital disease, reproduction and sexual medicine, inflammation, cancer, tissue repair, dermatology, skin pigmentation, photoaging, frailty, osteoporosis, cardiovascular disease, gastrointestinal disease, annihilection, allergy and respiratory disease, sensory organ disorders, sleep disorders or hair loss.

```

The present sequence represents a polypeptide which is a G-protein coupled receptor (GPCR) related to the EDG (undefined) receptor family, and is designated the 14274 receptor. The receptor polypeptides are useful for producting antibodies specific for the GPCR 14274 receptor protein, and in drug screening assays, in cell-based or cell-free systems. The receptor polypeptide may also be used to identify compounds that medulate receptor activity, that is compounds which stimulate or inhibit interaction between the receptor protein and a target molecule. Modulators of receptor protein activity are used to treat subjects with a disorder mediated by the GPCR 14274 receptor pathway, such as; an emplyseme, chronic brombitis), disorders of the colon (such as arenosis, enterocolitis), disorders of the liver (such as arresia, stenosis, enterocolitis), disorders of the liver (such as careatal edema, careatal disease, Alabelmer's disease, Parkinson's disease), disorders of the brain (such as cerebral edema, careforminal disease, Alabelmer's disease, Parkinson's transplant of disorders (such as sutclimmune disease), kidney disorders (such as stitligo, lentigo, malignant complement), skin diseases (such as sichemic heart disease), kidney disorders (such as sichemic heart disease), kidney disorders (such as sichemic heart disease), kidney disorders (such as sichemic ectasia), and prostate disorders (such as lifiammations, benign enlargement, tumours). New G-protein coupled receptor used in receptor assays as a target for diagnosis and treatment of receptor-mediated disorders of the spleen, lung, brain, heart and liver Claim 1; Fig 1; 102pp; English.

```
The present amino acid sequence is the hCHN6, an endogenous human orphan G protein-coupled receptor (GPCR). The hCHN6 cDNA was identified or using ESTS (expressed sequence tag) AA804531 and 2134670 as a probe.

"The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins can any also be used in the study of GPCR-mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue contains and pathological states.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

inverse agonists or partial agonists for use as pharmaceutical agents. AAA46017 to AAA46126 and AAB02825 to AAB02859 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes transmembrane receptors, preferably human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Non-endogenous, human G protein-coupled receptors for screening receptor, inverse or partial agonists useful as therapeutic agents
                                                                                                            Human; G protein coupled receptor; GPCR; transmembrane receptor; identification; agonist; screening; therapeutic; pharmaceutical;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Dang HT;
                                                                                      Human G protein coupled receptor hCHN6 protein SEQ ID NO:32.

intracellular signalling such as adenyl cyclase activity or intracellular calcium concentration. These agents have potential therapeutic applications as either analgesics or anaesthetics. BIC3 receptors are also useful for screening drug candidates using cell signalling assays. Antibodies to BIC3 are useful in purification of intact receptor or fragments of the receptor.
                                                                                                                                                                                          LINPIIYTLINRDLRHALLRLVCCGRHSCGRDPSGS-QQSASAAEAS-GGLRRCLPPGLD

                                                                                  This sequence represents human EDG-2. The inversion relates to methods of detecting (ant)agonist, inverse agonist or allosteric modulators of the lysophosphatidic acid receptors EDG-1, EDG-2, EDG-3, EDG-4, EDG-5, and PSP-24. The methods are used to identify (ant)agonists and allosteric modulator of the lysophosphatidic acid (LPA) EDG2 receptor, e.g. to treat LPA signalling mediated disease such cellular apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LPA receptor; EDG-2; lysophosphatidic acid; phospholipid; tumour; cell signalling; MAP kinase; LPA modulator; neurodegenerative disease; Alzheimer's disease; Parkinson's disease; neuron damage; apoptosis; ischaemic heart disease; viral; HIV; inflammatory bowel disease;

repair of neuronal cells, neurodegenerative diseases, such as Alzheimer's disease, parkinson's disease, and acute neuron damage, for modulating apoptotic pathways and treating ischeemic heart disease, tumours, viral diseases bowel disease, and rejection of organ transplants.
                                                                                                                                                                                                                                                                                   The sequence represents the LPA receptor-related amino acid sequence #1 used during analysis of lysophosphatidic acid receptor (LPA), EDG-2. The sequence is given in the specification but no further information is given. LPA is a phospholipid found in a variety of plant and animal products. EDG-2 is involved in cell signalling through activation of a MAP kinase, cascade-dependent reporter. Modilating the activity of a lysophosphatidic acid (LPA) or LPA receptor (EDG-2) involves introducing a composition comprising LPA modulators to the LPA or receptor. The method is useful for treating diseases characterised by slowed growth or method is useful.
                                                                                                                                                                 Modulating activity of a lysophosphatidic acid or its receptor for treating tumours, viral diseases, involves introducing to LPA or its receptor a composition containing diol, epoxide or phosphate compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  132 ERSLIMARRGPAPVSSRGRTLAMAAAAWGVSLLLGLLPALGWNCLGRLDACSTVLPLYAK 191

Agonists and antagonists of mouse EDGI are useful for treating patients with enhanced or inhibited activity or expression of EDGI. The EDGI polypeptide is useful for treating abnormal conditions such as infections caused by bacteria, fungletc., pain, cancer, diabetes, obesity, anorexia, bulimia, asthma, parkinson's disease, acute heart failure, hypotension, hypertension, uninary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, ulcers, allergies, bandon prostatic and neurological disorders including anxietty, schizophrenia, manic depression, depression, delitium, dementia and severe mental retardation and dyskinesias such as Huntington's disease or Gilles dela rourett's

p(H218); G-protein coupled receptor; cell differentiation; prolliferation; prolline directed kinase; cell division; growth factor response; rat-edg;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is a novel rat protein p(rat-edg), a member of the G-protein coupled receptor (GPR) superfamily of proteins. The amino acid similarity between p(H318) (AAW01663) and p(rat-edg) suggests that they may be activated by the same endogenous lignnd(s). The expression pattern of mRNA transcripts of both genes in cell lines, various rat tissues and developing rat brain suggests that they both play a role in cell proliferation and/or differentiation.

The present sequence represents a protein designated rat-edg. The rat-edg polypeptide is a member of the G-protein coupled receptor superfamily. The specification also describes a protein designated H218, which is also a member of the G-protein coupled receptor superfamily. H218 is involved in cell proliferation and differentiation, and in disease states such as cancer. The polynucleotides and polypeptides can be used to develop products for diagnosis and therapy.

                                                                                                                                                               G-protein coupled receptor encoded by human edg-1 gene.
                                                                                                            16-JAN-1992 (first entry)
                                                                                                                                                                                                                                                                                     Homo sapiens
                                                                                                                                                                                                                  This invention describes a novel human selective receptor for sphingosine-1-phosphate and dihydro sphingosine-1-phosphate, designated CC sphingosine-1-phosphate and dihydro sphingosine-1-phosphate, designated EDG-1C. The products of the invention have anti-arythmic, anti-HIV, anti-asthmatic, cytostatic, anti-anginal, antimicrobial, anti-asthmatic, cytostatic, anti-anginal, antimicrobial, consistentifying agonists and antagonists/Inhibitors, and for detecting deseases associated with inappropriate EDG-1c activity or levels. EDG-1c polypeptides and polynucleotides, agonists, antagonists and antibodies are used to treat diseases, including infections such as bacterial, are used to treat diseases, including infections such as bacterial, cancers; diabetes; obesity; anorexis, builmia; asthma; parkinson's retention; osteoporosis; angina pectoris; myocardial infarction; stroke; congestive heart failure; hypertension; hypertrophy; arrhythmia's; retention; osteoporosis; angina pectoris; myocardial infarction; stroke; congestive heart failure; left ventricular hypertrophy; arrhythmia's; deleterious fibrosis; artherosclerosis; inflammation; angiopenseis; wound congestive heart failure; between antericular hypertrophy; migraine; deleterious fibrosis; artherosclerosis; inflammation; angiopenseis; wound ting; psychotic and neurological disorders; including anxiety, schizophrenia, manic depression, depression, delizium, dementia, and neurological diseases such as neuroscleotide is also useful as a source of primers and dyskinesias such as untington's disease of dilles dela Touret's syndrome. The polynucleotide is also useful as a source of primers and probes, and also ceptor protein described in the method of the Invention.
                                                                                       t selective receptor for sphingosine-1-phosphate designated El
to treat human diseases and disorders, as well as infections
                                                                                                                                                                        Claim 1; Fig 2; 51pp; English.

```
This amino acid sequence was deduced from the edg-1 gene sequence obtained from a cDNA library from human umbilical vein endothelial cells. The protein has seven alternating hydrophobic regions (transmembrane domains), each of which is flanked by hydrophilic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA molecule encoding immediate early gene protein - is expressed in endothelial cells during immediate early stage of differentiation in response to PNA or IL-1
                                                                                                                                                                                                                 /label = intracellular_domain /note = "rich in basic amino acids"

The present invention describes a method (M1) for diagnosing anglogenesis (AG) comprising comparing expression of one or more genes (I) defined in the specification (preferably AAA4, AAA1, Edg-1, alpha 5 beta 1 integrin, condomucin or matrix metalloproteliase (I) or their fragments in a first itssue type of a first individual (WI) with the expression of gene(s) from a second normal tissue type from FI or a second unaffected in the expression indicates that FI has tissue that is undergoing AG. (I) can have immunostimulant, cytostatic, antidiabetic and ophthalmological activities, and can be used as angiogenesis modulator protein (AMP) inhibitors (e.g. an anti-AMP angiogenesis modulator protein (AMP) inhibitors (e.g. an anti-AMP diagnosing AG or AG disorders as well as screening for compositions which modulate AG. The AG polypeptides, nucleic acids and anti-AMP antibodies are an early an early and an early so an anti-AMP and an acceptance of the AG polypeptides, nucleic acids and anti-AMP antibodies are an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an early and an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diabetic retinopathy. The antibodies are also useful for diagnosing AG from blood samples. The AG genes are useful for generating animal models of AG. The present sequence represents an angiogenesis protein which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              192
